

# Project Sheet

## Frac Pond Liner Disposal

Location: Various

Waste: Frac pond liners with potential NORM scale

Hazards: NORM Scale

Services: NORM Survey, sampling, data interpretation, waste approvals, onsite safety, size reduction, transportation, documentation and final disposal

Secure CleanSite™ was retained by an oil and gas producer in NE BC for the removal of a number of pond liners used in frac rings from various locations. Some of the locations where the frac's were occurring had elevated levels of NORM (Naturally Occurring Radioactive Materials) scale being brought to surface therefore a NORM assessment was required prior to the removal of the liners. Secure CleanSite™ provided NORM surveying and sampling services, data interpretation, landfill or NORM facility processing approvals, on-site management which included the required size reduction of the liners, loading, transportation, site safety plan and proper waste and transport documentation.
